

FitBuddy AI

1. Brainstorming & Ideation

Project concept, problem statement, target users and initial feature ideas.

Project Idea

FitBuddy AI is a web application that generates personalized workout and nutrition plans from user-provided fitness information. The application combines a FastAPI backend, Jinja2 server-rendered pages and a Google Gemini model to produce structured, user-specific guidance.

Problem Statement

Many beginners do not know how to convert goals such as fat loss, fitness improvement or muscle development into a practical workout and nutrition routine. FitBuddy AI aims to simplify this process by collecting relevant user information and generating a clear starting plan.

Target Users

- Students and beginners who want a simple fitness plan.
- Users who want workout and nutrition suggestions in one place.
- Users who prefer a web interface instead of manually preparing plans.

Core Feature Ideas

- User input form for fitness profile and goals.
- Personalized workout-plan generation.
- Personalized nutrition-plan generation.
- AI-assisted recommendations using the configured Gemini model.
- Readable web pages for displaying generated plans.
- Basic validation and error handling.

Initial User Flow

- Open FitBuddy AI.
- Enter profile information and fitness goal.
- Submit the form.
- FastAPI validates/processes the request.
- The Gemini model is prompted with the relevant information.
- The generated plan is returned and rendered through Jinja2.
- User reviews the resulting workout and nutrition plan.

Scope Note

The project is intended as a planning assistant, not a substitute for a qualified medical or nutrition professional. The generated output should be presented with appropriate safety guidance.
