

FitBuddy AI

6. Performance Testing

Test cases, validation checks and performance observations.

Functional Test Cases

- Valid profile → plan is generated and displayed.
- Missing required field → validation message is shown.
- Invalid value → request is rejected safely.
- Gemini/API error → user receives a useful error message.
- Template rendering error → application logs the issue without exposing secrets.

AI Output Checks

- Workout section is present.
- Nutrition section is present.
- The output reflects the submitted goal and constraints.
- The output is readable and consistently formatted.
- No API key or internal secret is included in the displayed response.

Basic Performance Checks

- Measure request time for a normal plan-generation request.
- Observe behavior under repeated requests during local testing.
- Record whether slow AI responses cause a timeout or acceptable error state.
- Check that static assets load correctly.

Test Evidence to Upload

- Screenshots of successful generation.
- Screenshots of validation/error handling.
- A small test-case table or test report.
- Optional response-time observations from local testing.

Example Test Table

TC01: Valid user input — Expected: generated plan page — Result: Pass/Fail. TC02: Missing required input — Expected: validation message — Result: Pass/Fail. TC03: AI service failure — Expected: graceful error — Result: Pass/Fail. TC04: Invalid input — Expected: request rejected — Result: Pass/Fail.
