

FitBuddy AI

7. Documentation & Demo

User guide, setup instructions, architecture summary and demonstration script.

Project Overview

FitBuddy AI is a FastAPI + Jinja2 web application that uses a configured Google Gemini model to generate personalized workout and nutrition plans from user fitness information.

Setup Guide

- Install Python and create a virtual environment.
- Install dependencies from requirements.txt.
- Create a local environment file containing the required Gemini API key variable.
- Start the FastAPI application with the project's configured command.
- Open the local web address in a browser.

Demo Script

- Open the home page.
- Enter a sample fitness profile.
- Select/enter the desired goal and preferences.
- Submit the form.
- Show the generated workout plan.
- Show the generated nutrition plan.
- Demonstrate validation or error handling.
- Explain the architecture briefly.

Documentation Checklist

- README.md with project overview.
- Installation and run instructions.
- Technology stack.
- Environment-variable instructions.
- Feature list.
- Screenshots.
- Known limitations and future improvements.

Future Enhancements

- User accounts and saved plans.
- Plan history.
- More detailed progress tracking.
- Improved structured AI output.
- Automated tests and deployment.

- Additional accessibility and responsive UI improvements.
